MIŻIEN Claim Check 147 · Climate and energy, Malta

Did emissions intensity fall 19%?

A government factsheet, tested against Eurostat's tables

THE CLAIM

"GHG intensity per every euro generated between 2024 and 2020 in fact reduced by 19%"

Climate Action Authority, factsheet on air emissions accounts, February 2026

Excluding air and maritime transport; Eurostat's figures "show a growth rate of 87.2%".

The 19% is the Authority's own calculation; we rebuilt it from Eurostat data.

VERDICT

LARGELY SUPPORTED

Numbers check out; two valid measures compared.

SUPPORTED | **LARGELY SUPPORTED** | NOT SUBSTANTIATED | MISLEADING | CONTRADICTED

MAIN RESULTS

Grade C

Official data

Eurostat air emissions accounts, value added and the territorial inventory bridge.

68%

Air transport dominates

Share of Malta's 2024 emissions on Eurostat's residence basis (EU-27: 4%).

+86%

Eurostat's total, reproduced

GHG per euro of value added, 2020–2024, all activities (factsheet: +87.2%).

−22%

Without air and water transport

Our rebuild of the factsheet's −19%; territorial emissions per euro also give −22%.

2020

An unusual start year

Air transport's value added was negative in the Covid year, which flatters the fall; later start years give −8% to −15%.

FAIR TO SAY

Removing aviation changes the measure rather than correcting it: the factsheet itself says the Eurostat accounts count emissions by residence. Both figures are defensible.

WHAT WOULD SETTLE IT

- ☐ The Authority's workings for the −19%.
- ☐ The Eurostat data vintage it used.
- ☐ The periods behind the page-5 figures.
- ☐ Which measure should track progress.
