

92% excellent bathing water

*A public claim, tested against eleven seasons
of EEA bathing-water data*

THE CLAIM UNDER REVIEW

***“92% of Maltese bathing waters are
of excellent quality.”***

European Commission, Environmental Implementation Review 2025
True for 2023 and 2024 (80 of 87 sites). In 2025: 77 of 87, the lowest since 2015.

VERDICT: SUPPORTED

Accurate for 2023–24; date it.

TL;DR

The European Commission’s 2025 Malta review says **92% of Maltese bathing waters are excellent**. The EEA data confirm it: 80 of 87 sites in 2023, the season the Commission’s full report names, and 80 of 87 again in 2024, so the figure was accurate and current when published. The same data show a decade-long slide, from 86 of 87 sites (98.9%) in 2016–2018 to 77 (88.5%) in 2025, the lowest of the eleven seasons since 2015 and now level with the EU coastal average. Ten sites account for every rating below excellent; two at Balluta Bay have been rated only ‘sufficient’ for four seasons running.

- 1

The 92% figure checks out. The EEA rated 80 of 87 Maltese bathing sites excellent in 2023 (92.0%), the season the Commission’s staff working document gives, and again 80 of 87 in 2024.
- 2

It is not the latest result. In 2025, 77 of 87 sites (88.5%) were excellent; 8 were good and 2 sufficient. None was poor.
- 3

The share has fallen over ten years. 86 sites were excellent in each season 2016–2018; then 85, 84, 84, 82, 80, 80 and 77. Malta’s lead over the EU-27 coastal average shrank from 11 percentage points in 2016 to 0.2 in 2025 (Figure 1).
- 4

The decline is concentrated in a few bays. 77 sites were excellent in every season from 2015 to 2025. In 2025 St George’s Bay B03 (St Julian’s) and Xlendi D06 and D07 fell from excellent to good, while Birżebbuġa A11 and St Paul’s Bay C23 rose from sufficient to good (Figures 2 and 3).
- 5

Balluta Bay is a persistent problem. Its two sites were excellent in 2015–2018, good in 2019–2021 and only sufficient, the lowest passing class, in every season 2022–2025. The 2024 health warning fell within that run.
- 6

Verdict: supported, with a date caveat. Accurate for 2023 and 2024. Used today without its year, it overstates the current result by about three and a half percentage points.

THIS CLAIM

SUPPORTED

LARGELY SUPPORTED

NOT SUBSTANTIATED

MISLEADING

CONTRADICTED

80 / 87

Excellent in 2023 and 2024 (92.0%): the figure quoted

77 / 87

Excellent in 2025 (88.5%), the lowest since 2015

88.3%

EU-27 coastal average, 2025: Malta is now level with it

4 seasons

Balluta Bay B08 and B09 rated only sufficient, 2022–2025

WHAT WOULD MOVE THE VERDICT UP

None: Supported is the top of the scale. Only the date caveat remains; it would fall away if the Commission’s summary named the 2023 season beside the 92% figure.

WHAT WOULD MOVE IT DOWN

A different EEA count for 2023; a source showing that the Commission meant a later season (the 2025 result was 88.5%); or evidence that its percentage used an incompatible denominator.

IN THIS REPORT	
1 Claim and sources	4 Where the evidence points different ways
2 What the indicator measures	5 Balluta Bay and wastewater
3 What the season data show	6 Verdict and limits

1 Claim and sources

The Commission’s *Environmental Implementation Review 2025: Malta* summary states: “Malta also shows excellent records under the Bathing Water Directive: 92% of Maltese bathing waters are of excellent quality.” The sentence appears in the highlights and gives no reference year. The Commission’s full staff working document, SWD(2025) 318 of 7 July 2025, does: “in 2023, out of the 87 Maltese bathing waters, 80 (92%) were of excellent quality” [1, 2].

Source	What it establishes	Use
European Commission, EIR 2025: Malta, and SWD(2025) 318 [1, 2]	Exact 92% sentence; the full report dates it to 2023; wastewater discussed separately.	Claim wording
EEA bathing-water data: DiscoMap 2025 service and WISE dataset [3, 4]	Class of each of Malta’s 87 sites in every season 2015–2025, with coordinates; EU-27 totals.	Primary statistical series
EEA, Malta bathing-water profiles, 2024 and 2025 [5, 6]	Season totals and sample counts.	Cross-check
Directive 2006/7/EC [7]	What is measured, and how a season’s class is assessed.	Method
Environmental Health Directorate, Balluta Bay report (2024) [8]	Temporary warning at sites B08/B09 and when it was lifted.	Local context
CJEU, Commission v Malta, C-304/23 (2024) [9]	Urban wastewater treatment obligations for named agglomerations.	Separate compliance issue

Method. We downloaded the classification of every Maltese bathing water for each season from 2015 to 2025 from the EEA’s bathing-water map service, and checked each site and season from 2015 to 2024 against the EEA’s WISE dataset: all 870 match. EU-27 shares are counted from the same sources; the 2023 result, 88.9% of coastal bathing waters excellent, matches the EEA’s published figure. Data and scripts: *data/cc-005/*, *tools/cc-005-report/*.

2 What the indicator measures

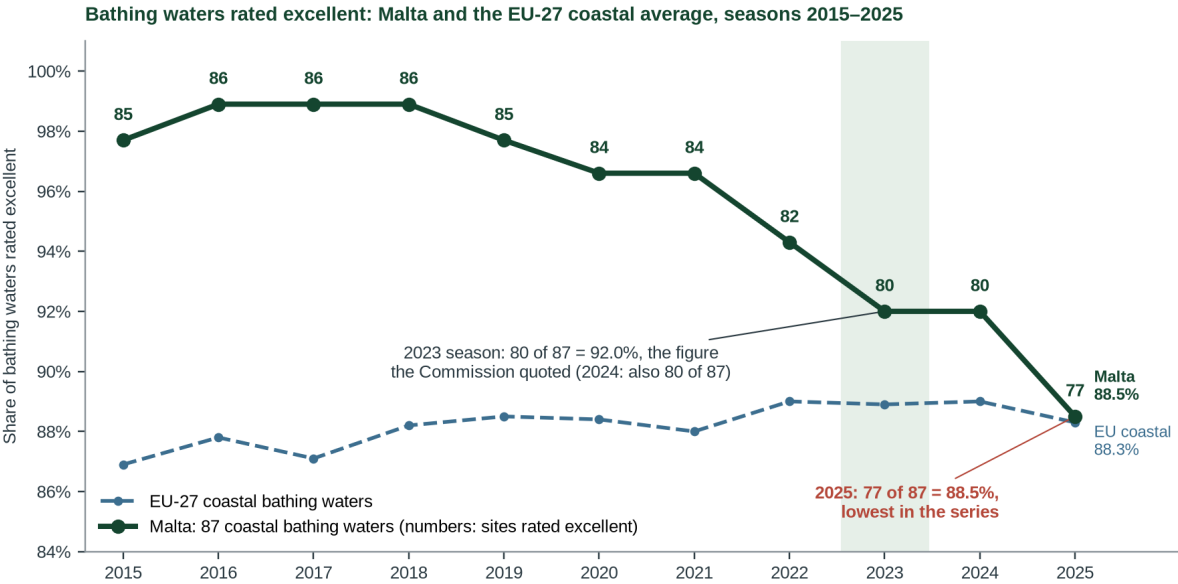

Under the Bathing Water Directive, classification rests on two faecal-indicator bacteria, *Escherichia coli* and intestinal enterococci. A season’s class is assessed from the samples of that season and the three before it, so a change in class reflects four seasons of results, not one bad week [7]. “Sufficient” is the minimum the directive requires; “excellent” is the best of four classes.

“Excellent” is a meaningful result for those parameters, but it does not cover every pollutant or the ecological and chemical state of the sea, and it does not rule out short-lived contamination: a site can receive a temporary warning and keep its class. The year and the denominator should accompany the percentage when it is repeated.

3

What the season data show

The 92% is the 2023 result, repeated in 2024. Seen across eleven seasons, it is a point on a falling line. Malta rated 86 of its 87 sites excellent in each season from 2016 to 2018. Since then the count has fallen every few seasons, to 77 in 2025 (Figure 1). Over the same period the EU-27 coastal average edged up, from 87.8% in 2016 to 88.3% in 2025, so Malta’s lead over it has all but gone.

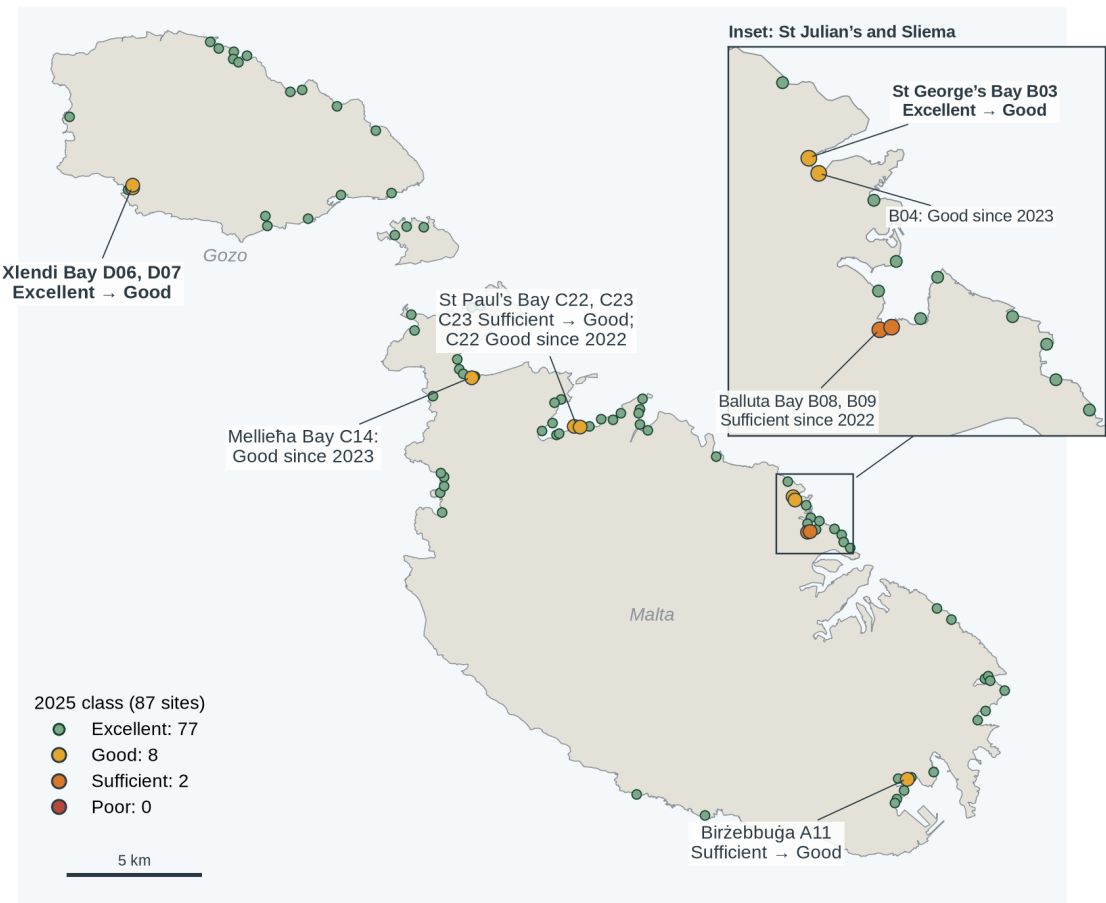

Each season's class rests on the last four seasons' samples. EU share: excellent ÷ all EU-27 coastal bathing waters, including those not classified.
Source: EEA bathing-water data (DiscoMap 2025 service; DiscoData WISE_BWD), retrieved 5 Oct 2026.

Figure 1. Share of bathing waters rated excellent, Malta and the EU-27 coastal average, seasons 2015–2025. Numbers above Malta’s line are the sites rated excellent out of 87.

Season	Excellent	Good	Sufficient	Poor	EU-27 coastal, excellent	Samples
2022	82 (94.3%)	2	3	0	89.0%	2,006
2023	80 (92.0%)	3	4	0	88.9%	2,021
2024	80 (92.0%)	3	4	0	89.0%	2,107
2025	77 (88.5%)	8	2	0	88.3%	2,100

Which sites. The decline is not spread along the coast. Of the 87 sites, 77 were excellent in every season from 2015 to 2025; ten account for every lower rating (Figure 3). Between 2024 and 2025 five sites changed class. Three fell from excellent to good: B03 on the left of St George’s Bay in St Julian’s, and D06 and D07 at Xlendi Bay in Gozo. Two rose from sufficient to good: A11 at St George’s Bay in Birżebbuġa and C23 in St Paul’s Bay (Figure 2). The net effect was three fewer excellent sites and two fewer sufficient ones.

Malta's 87 bathing waters by 2025 class, with the sites that changed class since 2024

Labels mark every site whose class changed between the 2024 and 2025 seasons, and the sites below excellent in both. Coastline © OpenStreetMap contributors. Source: EEA bathing-water data (DiscoMap 2025 service; DiscoData WISE_BWD), retrieved 5 Oct 2026.

Figure 2. Malta's 87 bathing waters coloured by their 2025 class, with the sites that changed class between 2024 and 2025 and those below excellent in both.

The 10 Maltese bathing waters rated below excellent in at least one season, 2015–2025

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025
B08 Balluta Bay, St Julian's					G	G	G	S	S	S	S
B09 Balluta Bay, St Julian's					G	G	G	S	S	S	S
A11 St George's Bay, Birzebbuga						G	S	S	S	S	G
C23 St Paul's Bay								G	S	S	G
D07 Xlendi Bay, Gozo	G	G	G	G							G
C22 St Paul's Bay								G	G	G	G
B04 St George's Bay, St Julian's									G	G	G
C14 Mellieħa Bay									G	G	G
D06 Xlendi Bay, Gozo	G										G
B03 St George's Bay, St Julian's											G

Excellent Good (G) Sufficient (S)

The other 77 sites were excellent in every season. Green outline: the 2023 season quoted by the Commission. Source: EEA bathing-water data (DiscoMap 2025 service; DiscoData WISE_BWD), retrieved 5 Oct 2026.

Figure 3. Class of the ten sites rated below excellent in at least one season, 2015–2025. Balluta Bay's two sites have been only sufficient since 2022; St George's Bay in St Julian's now has both sites at good.

4

Where the evidence points different ways

Q1 Was “92% excellent” a fair description of Malta’s bathing water?

ACCURATE, NOW DATED

EVIDENCE FOR THE CLAIM’S IMPRESSION

The figure is exact for 2023 and the Commission’s full report says so. The 2024 season gave the same 80 of 87, so the figure was also current when the review appeared in mid-2025. 92% was above the EU-27 coastal average (88.9% in 2023), and every Maltese site met at least the minimum standard.

EVIDENCE AGAINST

The summary sentence omits the year, and “excellent records” describes a record that was getting worse: 98.9% in 2016–2018, 92.0% in 2023–2024, 88.5% in 2025, the lowest in the series. In 2025 Malta was level with the EU coastal average. Two Balluta Bay sites have been at the minimum standard for four seasons.

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: the number was right when it was published, so the verdict stays Supported. The fair reading adds two things the sentence does not say: the result belongs to 2023 and 2024, and the trend since 2018 is downward. Quoted today without its year, 92% overstates the current result.

5

Balluta Bay and wastewater

Balluta Bay’s two sites, B08 and B09, were excellent from 2015 to 2018, good from 2019 to 2021 and only sufficient in every season from 2022 to 2025 (Figure 3). Because each class draws on four seasons of samples, that is a persistent problem at these two sites, not a single bad summer [7]. Within that run, the Environmental Health Directorate issued a temporary warning at both sites in late May 2024, after microbial contamination and foul water from a storm-water tunnel; it was lifted on 12 August after three consecutive samples fell below the thresholds [8]. The 2023 national count already reflects Balluta’s sufficient rating: the two sites are among the seven not rated excellent that year.

In Case C-304/23, the Court of Justice found failures to comply with urban wastewater treatment obligations for named agglomerations [9]. That judgment is not a bathing-water classification, and it does not show that the EEA’s 2023 result was false. The Commission’s own review reports bathing-water quality and wastewater treatment under separate headings.

FAIRNESS NOTE

Warnings and wastewater failures matter for public health and for the sea, but they measure different things from the national classification. This check assesses the dated statistic and what the same data show since; it does not judge whether every beach is always clean or whether Malta’s marine environment is healthy overall.

6

Verdict and limits

VERDICT

SUPPORTED

80 of 87 sites (92.0%) in 2023 and again in 2024. Since then: 77 of 87 (88.5%) in 2025. Confidence: high.

Why. The EEA’s data confirm 80 excellent sites out of 87 in 2023, the season the Commission’s full report names, which rounds to the 92% quoted; 2024 gave the same count, so the statement was current when published. Confidence is high because two EEA sources agree site by site. The caveat is the date: the share has fallen since 2018 and was 88.5% in 2025, so the year should be stated whenever 92% is used to describe Malta’s bathing water.

Limits. This verdict covers only the quoted statistic. The classification uses data reported by Malta; this check is not an independent sampling programme. It does not assess chemical pollutants, marine ecological status or health outcomes beyond the directive’s two microbiological indicators, and it does not explain why individual sites declined.

Right of reply has not been sought, as directed by the maintainer. The report remains a draft for maintainer review.

Appendix B: revision log

Version	Date	Change
1.0	2 Oct 2026	First issue. Right of reply not sought, at the maintainer’s direction.
1.1	5 Oct 2026	Corrections: (1) the ‘what would move the verdict’ boxes were reversed. ‘Up’ listed conditions that would lower the verdict, and ‘down’ cited a newer season at 92% or more. Now: up, none (Supported is the top of the scale; naming the 2023 season would remove the date caveat); down, a different 2023 count, a later intended season or an incompatible denominator. (2) Balluta Bay warning start: ‘31 May 2024’ → ‘late May 2024’. Our bibliography gave 21 May, and news reports date the two sites’ warnings ten days apart; the primary report could not be re-opened to settle it. (3) 2023 sample count: ‘—’ → 2,021 (EEA WISE dataset). (4) Page footer: ‘pending right of reply’ → ‘right of reply not sought’, matching the maintainer’s decision. Verdict and confidence unchanged.
1.2	5 Oct 2026	Upgrade: added the EEA classification of all 87 sites for every season 2015–2025 (map service, checked site by site against the WISE dataset) and the EU-27 coastal share; three figures (Malta against the EU coastal average, a map of the 2025 classes, and the ten sites ever below excellent). New findings stated: the 92% was also the 2024 result, so it was current when published; the share has fallen from 98.9% (2016–2018) to 88.5% (2025), the lowest since 2015 and level with the EU coastal average; the five sites that changed class in 2025 are named. Balluta Bay is now described as sufficient in every season 2022–2025, not as a single local episode. Added SWD(2025) 318, which dates the figure, and Directive 2006/7/EC. Verdict and confidence unchanged.
