

The lowest electricity burden in the EU?

Testing a ministry claim about household electricity prices against Eurostat and the IMF

THE CLAIM UNDER REVIEW

“...the burden on Maltese families is the lowest in the EU, at 14.33 PPS per 100kWh.”

Ministry for the Environment, Energy and Public Cleanliness, 6 May 2025.
Based on Eurostat figures for the second half of 2024.

VERDICT: LARGELY SUPPORTED

Lowest on price, second against income; subsidy cost left out

TL;DR

On 6 May 2025 the Energy Ministry said that “**Malta has the lowest electricity prices for domestic consumers in the European Union when measured in terms of purchasing power standards**”, and that “the burden on Maltese families is the lowest in the EU”. Every figure matches Eurostat, but burden is measured by price alone. **Measured against income, a typical Maltese bill is 2.2% of median income against 4.7% in the EU: the second lowest, after Luxembourg. On households’ actual use it is the fifth lowest.** Prices are held down by public subsidies that the release does not mention.

- 1

Every figure checks out. For a typical household (2,500–4,999 kWh a year), Malta’s 14.35 PPS per 100 kWh in 2024-S2 is the lowest of 27 and EUR 0.130 the third lowest in euros. In other consumption bands Malta ranks 2nd to 23rd (Figure 2).
- 2

Against income, second. A typical bill (3,750 kWh) takes 2.2% of median income (EU 4.7%) and 3.5% of a low income at the 20th percentile (EU 7.3%); second lowest both times, after Luxembourg (Figure 4).
- 3

On actual use, fifth. Maltese homes use more electricity than most (4,617 kWh a year, 21st of 27), a fifth of it for cooling. The average household’s bill is 1.3% of its disposable income (EU 1.9%), fifth lowest of 26.
- 4

The price is held down with public money. Malta’s price was cut from EUR 0.169 to 0.125 per kWh in 2014 and has barely moved since; the EU average rose 35% after 2020. The IMF puts energy subsidies (electricity and fuel) at about EUR 1 billion in 2022–2025.
- 5

Fewer struggle than the EU average, but not the fewest. 4.5% of people are in arrears on utility bills (EU 7.0%; 9th of 27) and 7.6% cannot keep the home adequately warm (EU 8.8%; 17th of 27).
- 6

Verdict: largely supported (high confidence). The price comparison is accurate, and Malta’s burden is among the EU’s lowest on every measure we tried, but the lowest only on price. The cost of keeping prices low, borne by public finances, is left out.

THIS CLAIM

SUPPORTED

LARGELY SUPPORTED

NOT SUBSTANTIATED

MISLEADING

CONTRADICTED

1st

Lowest price in purchasing power, typical household (2,500–4,999 kWh), 2024-S2

2nd

Typical bill as a share of median income, 2.2% (EU 4.7%); Luxembourg is lower

5th

Average household's actual bill as a share of its income, 1.3% (EU 1.9%)

€1.0bn

Energy subsidies 2022–2025, electricity and fuel together (IMF; 2025 projected)

WHAT WOULD MOVE THE VERDICT UP

Household Budget Survey results after 2022 showing the lowest share of spending on electricity in the EU, with the subsidy cost shown alongside.

WHAT WOULD MOVE IT DOWN

Evidence that subsidy costs fall on households through other bills, or newer data placing Malta lower on the income-based measures.

3 What the data show	7 Verdict and requests for evidence
4 What “burden” means: price, income and use	8 Limitations

1

The claim

The press release by the Ministry for the Environment, Energy and Public Cleanliness was read in full [1].

What was said	Access
“Malta has the lowest electricity prices for domestic consumers in the European Union when measured in terms of purchasing power standards (PPS)... for the second half of 2024.”	Read in full
“...third-lowest nominal electricity price... at €0.131 per unit... the burden on Maltese families is the lowest in the EU, at 14.33 PPS per 100kWh.” Czech Republic 41.00, Cyprus 35.70, Germany 35.23 PPS.	Read in full
“This is clear confirmation that our policy is working for the benefit of the people.” (Minister Miriam Dalli)	Read in full

2

Method

Eurostat household electricity prices (band DC, 2,500–4,999 kWh a year, all taxes) for all EU countries, 2019–2025, in euros and purchasing power standards, with the other consumption bands and Malta’s price since 2012 for comparison [2]; Eurostat energy-poverty indicators [3]; energy subsidies from the IMF’s 2025 Article IV report [4], converted to euros with Eurostat GDP. To test “burden” against income and use (Section 4) we added Eurostat income distribution (EU-SILC) [6], household electricity use and consumption by band [7], household numbers [8], household disposable income [9] and the 2020 Household Budget Survey [10], all retrieved on 5 October 2026 with their status flags. Numbers are recomputed by *tools/cc-022-report/calc.py* and *burden.py*. Official statistics and assessments are grade C.

3 What the data show

Households, consumption band DC (2,500–4,999 kWh), all taxes included, second half of 2024. Source: Eurostat nrg_pc_204 (retrieved 4 Oct 2026).

Figure 1. Household electricity prices in the EU, second half of 2024, typical household (2,500–4,999 kWh). Malta is third cheapest in euros and cheapest once prices are adjusted for purchasing power.

Malta is cheapest only in this standard band, which the release uses (Figure 2). In 2024-S2 it ranked 3rd in the band below (1,000–2,499 kWh) and 2nd in the band above (5,000–14,999 kWh), but 16th for the smallest users (under 1,000 kWh) and 23rd of 27 for the largest (15,000 kWh or more), and 4th of 26 on Eurostat's all-band average. In 2025-S2 the pattern is the same: 9th, 2nd, 1st, 2nd and 24th, and 3rd of 27 on the average [2]. For the largest users Malta's price per unit is more than double the typical one (31.9 against 14.35 PPS per 100 kWh in 2024-S2); in 19 of the 27 states it is lower for them.

Household prices in purchasing power standards, all taxes, by annual consumption band. Malta's 2025-S2 band prices are provisional. Luxembourg has no all-band average in 2024-S2 (26 countries). The Netherlands' price under 1,000 kWh is negative in 2024-S2, as Eurostat publishes it. Source: Eurostat nrg_pc_204 (retrieved 5 Oct 2026).

Figure 2. Malta's price and rank in each household consumption band, in purchasing power standards, second half of 2024 and of 2025. Grey dots are the other Member States; the blue line is the EU average.

Left: Eurostat nrg_pc_204, band DC (2,500–4,999 kWh), all taxes; 2025-S2 provisional for Malta. Right: IMF Country Report 26/29, Table 2 (% of GDP; 2025 grey = projection) x Eurostat nominal GDP.

Figure 3. Left: Malta’s price was cut in 2014 and has stayed flat since, while the EU average rose. Right: energy subsidies as the IMF reports them, covering fuel as well as electricity (2025 is a projection); the electricity share is not published separately.

Indicator	Claim	Eurostat / IMF	Grade
Malta, PPS per 100 kWh, 2024-S2, band 2,500–4,999 kWh	14.33, lowest	14.35, lowest of 27	C
Malta, nominal price, 2024-S2	EUR 0.131, third lowest	EUR 0.1303, third lowest	C
Czechia / Cyprus / Germany, PPS	41.00 / 35.70 / 35.23	41.00 / 35.70 / 35.23	C
Price change 2020-S1 → 2025-S2	“remained stable”	Malta -0.2%; EU +35.4%	C
Energy subsidies (electricity and fuel), 2022–2025	not mentioned	EUR 325m, 293m, 208m, 197m (2025 projected)	C
Unable to keep home warm, 2025	–	7.6% (EU 8.8%); 17th of 27	C
Arrears on utility bills, 2025	–	4.5% (EU 7.0%); 9th of 27	C

All values in data/cc-022/checks.csv.

4 What “burden” means: price, income and use

The release is titled “Maltese households with lowest burden”, and the minister calls the result “clear confirmation that our policy is working” [1]. A price in purchasing power standards corrects for how expensive a country is in general. It does not take account of what households earn, or of how much electricity they use: a cheap unit can still add up to a heavy bill for a household that uses a lot or earns little. We therefore measured burden four more ways, all from Eurostat, and ranked the 27 Member States on each (1 = lowest burden):

- **Typical bill against median income:** 3,750 kWh a year (the middle of the typical band) at the 2024 band price, all taxes, as a share of median equivalised net income from EU-SILC 2025, which measures 2024 income [2, 6].
- **The same bill against a low income:** the 20th percentile, the top of the poorest fifth [6].
- **The average household’s actual bill:** household electricity use divided by the number of households, priced at the average of the band prices weighted by consumption, as a share of households’ gross disposable income per household [7–9]. Income comes from the national accounts here because EU-SILC publishes income per adult-equivalent, not per household.
- **Electricity’s share of household spending** in the 2020 Household Budget Survey, the latest, which predates the 2022 price shock [10].

Malta is cheapest on price, second against income, fifth on actual use

Figure 4. Malta's rank among the EU Member States on each measure of burden (1 = lowest), with Malta's value and the EU-27 value. Grey dots are the other Member States.

Measure	Malta	EU-27	Malta's rank	Grade
Price in PPS per 100 kWh, typical household, 2024-S2 (the release's measure)	14.35	28.38	1st of 27	C
Bill for 3,750 kWh as a share of median income, 2024	2.2%	4.7%	2nd of 27 (Luxembourg 1.5%)	C
Same bill as a share of the 20th-percentile income, 2024	3.5%	7.3%	2nd of 27	C
Electricity use per household, 2024	4,617 kWh	3,524 kWh	21st of 27	C
Average household's annual bill, 2024	€689	€1,041	12th of 27	C
Average bill as a share of disposable income per household, 2024	1.26% (p)	1.91%	5th of 26	C
Electricity's share of household spending, 2020	2.3% (e)	2.8% (median of 24)	joint 7th of 24	C
Arrears on utility bills, 2025: all / below 60% of median income	4.5% / 9.2%	7.0% / 16.8%	9th / 7th of 27	C
Unable to keep the home adequately warm, 2025: all / below 60% of median income	7.6% / 10.9%	8.8% / 19.6%	17th / 9th of 27	C
Home not comfortably cool in summer, 2012 (latest)	35.4%	21.4%	25th of 27	C

Ranks: 1 = lowest burden or fewest people affected. (p) provisional; (e) estimated (Eurostat flags). The average bill is household use per household times the consumption-weighted price; Bulgaria has no household income in the national accounts, hence 26. All inputs and results: data/cc-022/eurostat_burden_inputs.csv and burden_measures.csv.

Does “lowest burden” hold?

On the release’s own measure, yes. Against income, Malta comes second, after Luxembourg, for a typical household and for a low-income one; the result is the same at 2,500 or 5,000 kWh, with 2023 incomes and with 2025 prices. For the average household’s actual bill Malta is fifth of 26, level with Slovakia. Before the 2022 shock, six other states

spent a smaller share of household budgets on electricity (Malta joint seventh of 24, with Belgium). On every measure Malta’s burden is well below the EU average and among the lowest in the EU. It is the lowest only on the price measure the release used.

Use matters. Maltese households use more electricity than most: 4,617 kWh a year, 21st of 27 (EU 3,524). In 2024 a fifth of it went on space cooling (19.5%; EU 3.1%) and a quarter on water heating (25.8%; EU 11.4%) [7]. A low price per unit therefore adds up to a larger bill than the price ranking suggests: €689 a year for the average household, 12th lowest of 27, against €1,041 in the EU.

Who struggles. Fewer people in Malta than in the EU as a whole are behind on utility bills (4.5% against 7.0%) or unable to keep the home warm (7.6% against 8.8%), but these rates place Malta 9th and 17th of 27, not first [3]. Among people below 60% of median income the rates are about half the EU’s. Summer comfort was last measured in 2012, when 35.4% of people in Malta said their home was not comfortably cool, against 21.4% in the EU (25th of 27) [11]; Eurostat publishes no later figure.

FAIRNESS NOTE

The tariff freeze is the policy the minister credits, and the income measures bear out its effect: since 2020, while the EU average price rose by about a third, Maltese bills stayed among the lightest in the EU relative to income. The other side is the cost. Energy subsidies for electricity and fuel together came to about €1 billion in 2022–2025 (IMF; 2025 projected) [4], paid through public finances and so, in the end, by taxpayers. No household-bill measure captures that.

5 Where the evidence points different ways

Q1 Is the burden on families the lowest in the EU?

ON PRICE YES; ON INCOME 2ND

EVIDENCE FOR THE CLAIM'S IMPRESSION

For a typical household (2,500–4,999 kWh), price adjusted for purchasing power is the lowest in the EU. Against income a typical bill is the second lowest (2.2% of median income; EU 4.7%), and fewer Maltese than average struggle to pay bills or heat their homes.

EVIDENCE AGAINST

PPS adjusts for general price levels, not for income or use. Against income Luxembourg is lower; on households' actual bills Malta is fifth of 26, because Maltese homes use more electricity than most; on keeping warm it is 17th of 27 (Section 4).

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: as a statement about price for a typical household it is accurate. As a statement about burden, Malta is among the lowest in the EU on every measure, but the lowest only on price.

Q2 Is it confirmation that the policy works?

INCOMPLETE

EVIDENCE FOR THE CLAIM'S IMPRESSION

Prices stayed flat through the 2022 energy shock, protecting households.

EVIDENCE AGAINST

The stability is paid for through public finances: the IMF puts energy subsidies, for electricity and fuel together, at about EUR 1 billion in 2022–2025, with 2025 projected [4]; the IMF recommends replacing untargeted subsidies with cost-recovery tariffs and targeted support.

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: the release presents the benefit without its cost.

6

Testing the claim

Sub-claim	What the evidence shows	Rating
A. Lowest price in PPS, 2024-S2	Confirmed by Eurostat for the standard household band (2,500–4,999 kWh), the one the release uses; not the lowest in other bands [2].	SUPPORTED
B. Third-lowest nominal price; comparison figures	Confirmed [2].	SUPPORTED
C. Prices stable since 2020	–0.2% vs EU +35% [2].	SUPPORTED
D. Lowest “burden” on families	True for price. Against income, 2nd of 27 for a typical and a low-income household; on actual bills, 5th of 26 (Section 4). The subsidy cost is not counted [4].	LARGELY SUPPORTED

7

Verdict and requests for evidence

VERDICT

LARGELY SUPPORTED

Every figure is accurate; the cost of keeping prices low is left out. Confidence: high.

Why. The statistical claims match Eurostat exactly. The word “burden” and the minister’s conclusion rest on price alone. Measured against income, Malta’s burden is the second lowest in the EU, after Luxembourg, and the fifth lowest on households’ actual bills: among the lowest on every measure, but the lowest only on the price the release used. Fixed electricity and fuel prices are financed by public subsidies the IMF puts at about EUR 1 billion over 2022–2025 (electricity and fuel together; 2025 projected). These qualify the claim without contradicting it.

Evidence we are asking for

- ☐ The electricity-only subsidy to Enemalta by year, separate from fuel.
- ☐ Household spending on electricity as a share of income, by income group, after 2022 (the latest EU Household Budget Survey is from 2020).

8

Limitations

- The IMF subsidy series covers electricity and fuel; 2025 is a staff projection.
- The income measures combine sources with different bases: EU-SILC income is per adult-equivalent while a bill is per household; national-accounts income includes non-profit institutions and imputed items and is higher than survey income; household numbers come from the Labour Force Survey. They rank countries under stated assumptions rather than give exact burdens. Malta’s 2024 household income is provisional, and Malta and Slovakia are 0.003 points apart on the actual-bill measure.
- The 2024 bill is matched to EU-SILC 2025, which measures 2024 income; with EU-SILC 2024 (2023 income) Malta’s ranks are unchanged.
- The spending share is from 2020, before the 2022 price shock; summer comfort was last measured in 2012.
- The comparison uses band DC (2,500–4,999 kWh), a typical household; Malta is not the cheapest in the other bands (Section 3).

- The release gives 14.33 PPS; Eurostat’s current figure is 14.35. We did not keep the data as published in May 2025, so we cannot say whether this reflects a revision; the ranking is the same.

Appendix A: series standards and verdict scale

Every investigation in this series follows the same rules so that verdicts are comparable and challengeable.

Verdict	Meaning
SUPPORTED	Evidence consistently backs the claim as stated.
LARGELY SUPPORTED	Backed by the evidence, with minor caveats that do not change the substance.
NOT SUBSTANTIATED	Stated more strongly than the evidence offered or available allows. May be true in some conditions but has not been shown.
MISLEADING	Omits material facts so that the overall impression is inaccurate, even if individual statements are defensible.
CONTRADICTED	The available evidence points against the claim.

Confidence

High: multiple independent lines of evidence agree. **Moderate:** evidence is relevant but incomplete or indirect. **Low:** evidence is thin, second-hand or conflicting.

Evidence grades

A experiment · B observational study with a control or gradient · C review, guidance or official statistics · D assertion or anecdote.

Standards

- **Quote the speaker, not the headline**, with outlet and date, and link the original where possible.
- **Separate the claim from the evidence offered for it**, and say who made which statement.
- **Grade the evidence** and show differing views side by side where the evidence is unsettled.
- **State what we could not access or verify**, and what would change the verdict either way.
- **Ask for the missing evidence** in specific, answerable requests.
- **Offer a right of reply** before wider circulation and append responses.
- **Correct errors openly** with a version number and change log.
- **Whistle-blow only on evidence:** a verdict of *Misleading* or *Contradicted* requires documents or data that can be shown, not inference.
- **Check every side.** Government, opposition, NGOs and developers are held to the same standard.

Appendix B: revision log

Version	Date	Change
1.0	4 Oct 2026	First issue. Right of reply to the Energy Ministry not yet sent.
1.1	5 Oct 2026	Corrections. (1) “Lowest in the EU” now says it holds for the standard household band (2,500–4,999 kWh) (TL;DR, tile, Figure 1 caption, table, Q1, sub-claim A, flyer, thumbnail); added one sentence on the other bands (2024-S2: 3rd, 2nd, 16th, 23rd of 27; 4th of 26 on the all-band average). (2) “Tariffs have been frozen since 2014” (no source) → Eurostat’s series: EUR 0.169 (2013-S2) to 0.125 per kWh (2014-S2), then 0.125–0.133 to 2025-S2. (3) The IMF’s EUR 1 billion is now described as energy subsidies for electricity and fuel together, with 2025 projected: Figure 2 caption “what that stability cost” → “energy subsidies as the IMF reports them”; “tariff freeze is financed by” → “fixed electricity and fuel prices are financed by” (TL;DR, Q2, Why, table, tile, flyer). (4) “Eurostat revised 14.33 to 14.35” → difference noted without asserting a revision. (5) IMF reference: DOI added. Verdict and confidence unchanged.
1.2	5 Oct 2026	Upgrade: (1) New Section 4 tests “burden” against income and use (Eurostat; Figure 4 and a table): typical bill 2.2% of median income (EU 4.7%), 2nd of 27 after Luxembourg; 3.5% of a 20th-percentile income, 2nd; average household’s actual bill 1.26% of disposable income, 5th of 26; spending share 2.3% in 2020, joint 7th of 24; arrears 9th and keeping warm 17th of 27; summer comfort 2012 (25th). (2) New Figure 2: Malta’s price and rank in every consumption band, 2024-S2 and 2025-S2. (3) Figure 3 (was 2) now starts in 2012 and shows the 2014 tariff cut. (4) TL;DR, key points, tiles, Q1, sub-claim D text, Why, Limitations, references and flyer updated; fairness note added. Verdict, confidence and sub-claim ratings unchanged.
