

Cleaner air, already?

ERA's statement that its Air Quality Plan's measures have already worked, tested against station data

THE CLAIM

“The plan outlines actions that have already yielded positive results for Malta’s air quality...”

Environment and Resources Authority, Air Quality Plan for Malta 2025 web page, 12 March 2025 (page metadata)

The plan names six: power reform, grants, free school transport, ferry landing places, a fast ferry, free public transport.

Tested with validated EEA data, 2006–2025, and ERA's own reports.

VERDICT

NOT SUBSTANTIATED

Power reform shown to help; transport measures not shown.

SUPPORTED

LARGELY

MISLEADING

CONTRADICTED

MAIN RESULTS

–99.8%

Power-station sulphur cut

Sulphur oxides from power stations, 2014 to 2018 (–99.9% since 2008, 55% of it before 2015); SO₂ in the air fell 83% at Żejtun.

–22%

NO₂ at Msida

2015–17 to 2021–23, in step with a cleaner fleet; not tied to any named measure.

52 days

PM10 limit exceeded, 2023

After ERA deducts dust and sea salt (35 allowed); worst of 2015–23 at the old monitor. One site, one year, no weather adjustment.

+8.1

After free transport

µg/m³ PM10 at Msida, year after Oct 2022 vs year before; 10 of 11 readings rose. One site, one year, no weather adjustment.

4 of 6

No air data offered

Grants, ferry landings, fast ferry, free transport: uptake or passengers only.

FAIR TO SAY

ERA states the 2018 and 2023 exceedances itself, and the plan says traffic growth offset gains. Flat PM10 does not prove the measures did nothing.

WHAT WOULD SETTLE IT

☐ The study behind “already yielded”.

☐ Data for the school-transport figures.

☐ Traffic counts near Msida, 2018–23.

☐ Sources of the 2023 PM10 excess.
