

More in 2030 than in 2005?

The European Commission's projection for Malta, tested against the data and the law

THE CLAIM

“...This means Malta is projected to emit more in 2030 than in 2005.”

European Commission, EU Climate Action Progress Report 2025, COM(2025) 668, p. 30, 6 Nov 2025

“Malta's gap to target is 49 and 61 percentage points, exceeding its 19% reduction target.”

Effort-sharing sectors: transport, buildings, waste, farming, small industry, refrigerant gases.

VERDICT

SUPPORTED

Reproduced from Malta's own projections and EU law.

MISLEADING

CONTRADICTED

MAIN RESULTS

49 / 61

The gap is right

Points of gap to the –19% target, with planned / existing measures: 48.7 and 61.1 on our count.

+30% / +42%

Above 2005 in 2030

1,324 / 1,450 kt against 1,021 kt in 2005. True for every 2005 figure we found.

+41%

Already above in 2024

1,437 kt in 2024 (approximated). Over the yearly limit in 2022, 2023 and 2024.

1st of 27

Largest gap in the EU

In percentage points: Malta 49, Ireland 20, Germany 13. In tonnes Malta's gap is small (0.5 Mt).

1.6 Mt

Left after flexibilities

Over 2021–30, after the ETS flexibility and land credits: to buy from other states or cut.

FAIR TO SAY

Malta's plan says the target rests on 2005 forecasts. Population has since grown 41%, and effort-sharing emissions per person are flat. EU law accepts the target is above Malta's cost-effective potential.

WHAT WOULD SETTLE IT

☐ How Malta will cover its 2026–2030 excess, and at what cost.

☐ Approximated 2025 emissions and the 2027 projections.

☐ The effect of the new ETS2 on transport and buildings.

☐ Measures for transport, flat at 737 kt in both projections.
