

Do permits keep prices in check?

Testing a public claim about housing supply and prices in Malta against research, Eurostat and the census

THE CLAIM UNDER REVIEW

“Continuing to issue permits helps keep property prices in check.”

Johann Buttigieg, Planning Authority CEO, MaltaToday interview, 2 March 2025.
Answering a question on 91,000 dwellings approved in a decade.

VERDICT: LARGELY SUPPORTED

Right in direction; the size of the effect is unproven

Version 1.2 · 5 October 2026

Status: draft · no right of reply needed

Prepared from public sources, Eurostat and NSO data.

TL;DR

In a March 2025 interview with MaltaToday, Planning Authority chief executive Johann Buttigieg was asked whether approving 91,000 dwellings in a decade was sustainable. He replied: **“Had we not issued these permits, Malta would face the same housing crises as other European countries. This is a supply-and-demand issue – continuing to issue permits helps keep property prices in check. Stopping them would drive prices up.”** We tested the economics against peer-reviewed research and the Malta data against Eurostat for all 27 Member States. Malta had the EU’s fastest population growth in 2015–2025, yet its real house-price rise ranked only 16th of 27; rents rose two and a half times as fast as the EU’s.

- 1

The mechanism is well supported. Peer-reviewed studies in the US and England find that where supply is held back, demand growth shows up as higher prices rather than more homes.
- 2

Malta absorbed the EU’s largest demand shock. Population grew 31% in 2015–2025, the most in the EU and about 16 times the EU’s 2%. Real house prices rose 34% (provisional); more than the EU aggregate (25%), but less than in 15 of the other 26 states (median 41%; Figure 3).
- 3

But not everything was held in check. Rents rose 53%, against 21% in the EU (8th fastest of 27). Housing-cost overburden rose from 1.1% to 2.9% in 2015–2022 while the EU’s fell, and has held at about 6% since a 2023 series break.
- 4

The counterfactual cannot be proved. No study estimates Maltese prices with fewer permits, and over a quarter of dwellings are not anyone’s main home.
- 5

Verdict: largely supported (moderate confidence). As a statement about supply and demand, the claim agrees with the evidence. The caveats concern how large the effect is and the worsening affordability trend, which the statement does not mention.

1 The claim and what we could verify

The claim is the chief executive’s answer in a MaltaToday interview by James Debono published on 2 March 2025 [1], which we read in full. The interviewer’s question gave the figure of 91,000 new dwellings approved in the past decade, including 21,000 on previously undeveloped land; the answer did not repeat it. The Authority’s own series gives 87,814 units approved in 2015–2024 [2], close to the interviewer’s figure.

What was said	Who	Access
“Had we not issued these permits, Malta would face the same housing crises as other European countries.”	Chief executive [1]	Read in full
“This is a supply-and-demand issue – continuing to issue permits helps keep property prices in check. Stopping them would drive prices up.”	Chief executive [1]	Read in full
91,000 new dwellings approved in the past decade	Interviewer [1]	Read; PA series gives 87,814 [2]

SCOPE NOTE

This check is about prices and the supply argument only. It does not assess the environmental cost of the permits, building design, or whether the land used was the right land: those are separate questions. In the same interview the chief executive said affordability “is a concern” and proposed smaller minimum flat sizes.

2 Method

Question. Does issuing permits help keep prices in check, and is Malta better placed than other European countries because of it?

Evidence. Peer-reviewed literature on housing supply and prices, found through Crossref and OpenAlex and verified by DOI [5–8]. Eurostat house prices (nominal and deflated), permits, population, housing-cost overburden and overcrowding for Malta and the EU, and population, real house prices, rents and the latest quarterly prices for all 27 Member States, with status flags [3]; the Planning Authority’s series of approved dwellings [2]; and the NSO 2021 census of dwellings [4]. All numbers are recomputed by *tools/cc-013-report/calc.py* from files in *data/cc-013/*.

Grades. Peer-reviewed observational studies with controls are grade B; official statistics are grade C. **Verdicts** follow the five-point scale in Appendix A.

3 What the research says

Economists agree that supply matters for prices; they disagree on how much. Glaeser, Gyourko and Saks found Manhattan prices far above construction costs and attributed the gap to land-use regulation; in constrained markets, rising demand led “not to more housing units but to higher prices” [5]. Hilber and Vermeulen, using 353 English planning authorities over 34 years, found that regulatory constraints make prices respond more strongly to rising incomes [6]. Saiz showed that supply elasticity depends on both geography and regulation [7]: both are tight in Malta.

On the other side, Anenberg and Kung modelled what happens when supply is added and found that rents respond only weakly, because location and amenities matter more than the number of units; marginal easing of constraints “alone” is unlikely to cut rent burdens much [8]. The research therefore supports the direction of the claim (more permits, less upward pressure) but not any particular size of effect.

4 What the Malta data show

House prices deflated by HICP. Sources: Planning Authority, Approved Dwelling Units 2007–2025; Eurostat tipsho10, demo_gind (retrieved 3 Oct 2026). Changes shown are 2015–2025.

Figure 1. Dwelling units approved each year (bars) with real house prices in Malta and the EU and Malta's population, indexed to 2015. Approvals more than tripled after 2015 as population growth accelerated. Malta's 2025 house-price index is provisional.

Figure 2. Housing-cost overburden and overcrowding, Malta and EU-27. Malta remains below the EU on both. Its overburden rate rose from 1.1% to 2.9% in 2015–2022 while the EU's fell; Eurostat flags a break in Malta's series in 2023, so the step from 2.9% to 6.0% is not a like-for-like change.

Indicator	Malta	EU-27	Source	Grade
Population change 2015–2025	+31% (1st of 27)	+2%	Eurostat demo_gind	C
Real house prices, 2015–2025	+34% (p); 16th of 27	+25% (median state +41%)	Eurostat tipsho10	C
Rents (HICP actual rentals), 2015–2025	+53% ; 8th of 27	+21%	Eurostat prc_hicp_aind	C
House prices, annual change to 2026-Q2 (nominal)	+6.9% (p)	+4.7%	Eurostat prc_hpi_q	C
Nominal house prices, 2015–2024	+64%	+53%	Eurostat prc_hpi_a	C
Housing-cost overburden, 2015 → 2022; 2023 → 2025 (break in Malta's series in 2023)	1.1% → 2.9%; 6.0% → 6.0%	11.2% → 8.7%; 8.8% → 7.7%	Eurostat ilc_lvho07a	C

Indicator	Malta	EU-27	Source	Grade
Overcrowding, 2025	4.7%	16.8%	Eurostat ilc_lvho05a	C
Dwellings approved 2015–2024	87,814	–	Planning Authority [2]	C
Dwellings not a main residence, 2021	27.5% (31.8% in 2011)	–	NSO census [4]	C

All values in data/cc-013/checks.csv. Real prices are the house price index deflated by consumer prices (HICP), to 2025; nominal prices are not deflated and run to 2024. (p) provisional. Ranks: 1 = largest rise among the 27 Member States.

Malta among the 27

Compared with every Member State rather than with the EU aggregate, the picture changes (Figure 3). Malta’s population grew 31% in 2015–2025, the most in the EU (Luxembourg 21%, Ireland 16%) and about 16 times the EU’s 1.9%. Its real house prices rose 34%, which ranks 16th of 27: below the median Member State (41%) and far below Portugal (106%) and Hungary (104%). The EU aggregate (25%) is low partly because Germany (16%), France (4%) and Italy (–5%) carry 49% of its weight [3].

Figure 3. Change in population and in real house prices, 2015–2025, all 27 Member States. Malta is far to the right on population and below the median on prices.

Rents tell a different story. Rents paid by tenants (the HICP index of actual rentals) rose 53% in Malta over the same decade, against 21% for the EU: the 8th fastest rise of 27 [3]. The latest quarterly figures show house prices still rising faster than the EU’s: 6.9% in the year to the second quarter of 2026, against 4.7% (both provisional for Malta; nominal).

5

Where the evidence points different ways

Q1 Did permits keep prices in check?

IN DIRECTION, NOT IN LEVEL

EVIDENCE FOR THE CLAIM'S IMPRESSION

Population grew 31%, the most in the EU, while real prices rose 34%: less than in 15 of the other 26 states and below the median state (41%). In our reading, supply on this scale is a plausible reason prices did not rise much faster. This is our inference: it is consistent with the research but has not been tested for Malta.

EVIDENCE AGAINST

Malta's real prices outpaced the EU aggregate, rents rose 53% against 21%, and prices grew fastest in the record-approval years (about 3.8% a year in years with 9,000+ approvals against 1.7% in other years). Approvals respond to demand, so this does not show permits raised prices, but it does show they did not hold every housing cost down.

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: "helps keep prices in check" is consistent with the evidence as a statement about direction, and Malta's place among the 27 is consistent with it; it cannot be read as a claim that housing costs are under control, as rents show.

Q2 Would Malta face the same crisis as other European countries?

PARTLY SUPPORTED NOW;
GAP NARROWING

EVIDENCE FOR THE CLAIM'S IMPRESSION

Malta's overcrowding (4.7%) is a quarter of the EU rate and its overburden rate (6.0%) is still below the EU's (7.7%). Its real house-price rise was below that of most Member States despite the EU's fastest population growth.

EVIDENCE AGAINST

Malta's overburden rate rose from 1.1% to 2.9% in 2015–2022 while the EU's fell. The jump to 6.0% in 2023 coincides with a break in Eurostat's series, so it is not a like-for-like change; the rate has held at about 6% since. Rents rose two and a half times as fast as the EU's.

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: on today's indicators Malta is not in a worse position than the EU average, but the trend is towards it.

Q3 Do approvals add homes for residents?

MOSTLY, NOT ENTIRELY

EVIDENCE FOR THE CLAIM'S IMPRESSION

The share of dwellings that are not a main residence fell from 31.8% to 27.5% between 2011 and 2021 [4]: most new stock was occupied.

EVIDENCE AGAINST

81,613 dwellings (27.5%) were secondary, seasonal or vacant in 2021. Approvals are not completions, and small, investor-oriented units may not match households' needs.

WHY THEY DIFFER, AND WHAT IT MEANS HERE

For this claim: the supply argument holds best for approvals that become homes people live in.

6

Testing the claim

Sub-claim	What the evidence shows	Rating
A. Price is a supply-and-demand issue; more permits help keep prices in check	Supported in direction by peer-reviewed studies [5–7]; effect size uncertain and possibly small for affordability [8].	LARGELY SUPPORTED
B. Stopping permits would drive prices up	Consistent with the same research; not tested for Malta directly.	LARGELY SUPPORTED
C. Without the permits Malta would face the same crises as other European countries	Counterfactual. Malta is below the EU on overcrowding and overburden today, and its real price rise ranks 16th of 27 despite the fastest population growth; but its prices outpaced the EU aggregate, rents rose 53% (EU 21%) and overburden is rising.	NOT SHOWN
D. 91,000 dwellings in a decade (interviewer)	87,814 approved 2015–2024 [2].	CLOSE

7

Verdict and requests for evidence

VERDICT

LARGELY SUPPORTED

Agrees with the research on supply and prices; the size of the effect is unproven and affordability is worsening.
Confidence: moderate.

Why. (1) The research consistently finds that restricting housing supply raises prices, so issuing permits plausibly restrains them. (2) Malta absorbed the EU’s fastest population growth, about 16 times the EU’s, with real price growth above the EU aggregate but below that of most Member States (16th of 27), and remains below the EU on overcrowding and cost overburden. (3) The statement does not show how much permits restrain prices, and affordability worsened between 2015 and 2022 on Eurostat’s comparable series, and rents rose 53% against 21% for the EU. These caveats limit the claim but do not reverse it, which our scale calls *Largely supported*.

What this verdict does not say. It does not say that more permits are good overall, that the land, design or environmental costs are justified, or that prices are affordable. It says that, as an economic statement about supply and prices, the claim agrees with the evidence.

Evidence we are asking for

- ☐ Completions (not only approvals) by year and type, and how many new units become main residences.
- ☐ Any Malta-specific estimate of how prices respond to approvals, controlling for demand.
- ☐ The source and definition of the 91,000 figure used in the interview question.

8

Limitations

- The research cited is from the US and England; no peer-reviewed estimate of supply elasticity for Malta was found.
- Approvals are not completions; we did not find a completions series.
- Malta’s overburden rate jumps between 2022 and 2023, the year Eurostat flags a break in its series; we compare only within 2015–2022 and 2023–2025.
- National averages hide differences between localities, tenures and income groups.

- Peer-reviewed papers were read as abstracts; findings used are those stated in the abstracts.
- EU-27 comparisons use annual averages. Malta's 2025 house price index and the 2026 quarterly figures are provisional; Bulgaria and Cyprus have series breaks in 2015 and Greece's values are estimated. The rent index covers rents paid by tenants, not the costs of owner-occupiers.

Appendix A: series standards and verdict scale

Every investigation in this series follows the same rules so that verdicts are comparable and challengeable.

Verdict	Meaning
SUPPORTED	Evidence consistently backs the claim as stated.
LARGELY SUPPORTED	Backed by the evidence, with minor caveats that do not change the substance.
NOT SUBSTANTIATED	Stated more strongly than the evidence offered or available allows. May be true in some conditions but has not been shown.
MISLEADING	Omits material facts so that the overall impression is inaccurate, even if individual statements are defensible.
CONTRADICTED	The available evidence points against the claim.

Confidence

High: multiple independent lines of evidence agree. **Moderate:** evidence is relevant but incomplete or indirect. **Low:** evidence is thin, second-hand or conflicting.

Evidence grades

A experiment · B observational study with a control or gradient · C review, guidance or official statistics · D assertion or anecdote. ♦ marks a source known only second-hand.

Standards

- **Quote the speaker, not the headline**, with outlet and date, and link the original where possible.
- **Separate the claim from the evidence offered for it**, and say who made which statement.
- **Grade the evidence** and show differing views side by side where the evidence is unsettled.
- **State what we could not access or verify**, and what would change the verdict either way.
- **Ask for the missing evidence** in specific, answerable requests.
- **Offer a right of reply** where a check finds a claim Not substantiated, Misleading or Contradicted (or a pledge Not measurable, Off track or Missed), before wider circulation, and append responses.
- **Correct errors openly** with a version number and change log.
- **Whistle-blow only on evidence:** a verdict of *Misleading* or *Contradicted* requires documents or data that can be shown, not inference.
- **Check every side.** Government, opposition, NGOs and developers are held to the same standard.

Appendix B: revision log

Version	Date	Change
1.0	3 Oct 2026	First issue. Right of reply to the Planning Authority not yet sent.
1.1	5 Oct 2026	Corrections. (1) Housing-cost overburden: Eurostat flags a break in Malta's series in 2023, so "1.1% (2015) → 6.0% (2025)" and "more than fivefold" → like-for-like runs "1.1% → 2.9% (2015–2022)" and "6.0% → 5.9% → 6.0% (2023–2025)" (TL;DR, tiles, Figure 2 caption, Section 4 table, Q2, Section 7, Limitations, flyer). (2) Real house prices 2015–2025 (+34% Malta, +25% EU) now written to checks.csv by calc.py, which previously held only 2015–2024 (+26%, +21%); Malta's 2025 value marked provisional (TL;DR, tiles, Figure 1 caption, table "+34%" → "+34% (p)"); table note now states each price row's basis and period (real, HICP-deflated, to 2025; nominal to 2024). (3) data/cc-013/eurostat_housing.csv: the second sts_cobp_a series each year relabelled as m ² of useful floor area (it had the dwellings label); Eurostat flags recorded. (4) Q1: "the most plausible reason ... the research supports this" → stated as our inference, not tested for Malta. Verdict and confidence unchanged.
1.2	5 Oct 2026	Upgrade: (1) New Figure 3 and subsection comparing all 27 Member States (Eurostat demo_gind, tipsho10): Malta's population growth 2015–2025 is the highest (+30.9%; Luxembourg +21.1%), its real house-price rise (+34.2%, provisional) ranks 16th of 27, below the median state (+41.2%); Germany, France and Italy carry 49% of the EU-27 index weight. (2) Rents added (HICP actual rentals): +53.1% vs EU +20.5%, 8th of 27. (3) "Population growth fifteen times the EU's" → "about 16 times" (30.87% / 1.90% = 16.3). (4) Latest quarter added: house prices +6.9% a year to 2026-Q2 (EU +4.7%; provisional). (5) TL;DR, key points, tiles, table, Q1, Q2, sub-claim C text, Why, Limitations and flyer updated. Verdict and confidence unchanged.
1.2	5 Oct 2026	Maintainer decision (5 Oct 2026): a right of reply is sought only where a check finds a claim Not substantiated, Misleading or Contradicted, so this check needs none; cover, page footer and flyer now say "no right of reply needed".
