

Is Malta first in the EU for reported pollution?

Testing a media claim about Malta's share of people reporting pollution against Eurostat data

THE CLAIM UNDER REVIEW

“35% of people in Malta reported exposure to pollution in 2023 — the highest share in the EU.”

Amphora Media, 2026 Election Guidebook: The Environment, 12 May 2026.
Source not named; the figures match Eurostat's EU-SILC data.

VERDICT: SUPPORTED

Accurate; reported problems, in Eurostat's own words

Version 1.1 · 5 October 2026

Status: draft · no right of reply needed

Prepared from public sources and Eurostat data.

TL;DR

Amphora Media’s 2026 Election Guidebook: The Environment (12 May 2026) says: **“35% of people in Malta reported exposure to pollution in 2023 — the highest share in the EU.”** In the body it adds that this is “nearly three times the EU average of 12%”. Amphora does not name its source. We tested both statements against Eurostat’s EU-SILC survey indicator on pollution, grime and other environmental problems.

- 1

The numbers are right. Eurostat gives 34.7% for Malta and 12.2% for the EU-27 in 2023. Rounded, that is 35% and 12%; the ratio is 2.84.
- 2

Malta is first in the EU, by a wide margin. Greece is second at 20.5%. Malta has been first in every survey year with data since 2005 (17 of 17), and in 2023 it was also above every non-EU country in the table (the highest, Türkiye, 19.8%).
- 3

“Reported exposure” is Eurostat’s own wording. The survey asks whether the household has a problem with pollution, grime or other environmental problems in its area. Eurostat describes the result as people “reporting exposure to pollution, grime or other environmental problems”; Amphora’s intro line shortens that. It records what people report, not measured air quality.
- 4

Up since 2017, below the 2010–14 peak. The share was 41.4% in 2011 and 26.5% in 2017. At 34.7%, 2023 is 8.2 points above that low and the highest since 2014 (37.4%).
- 5

Verdict: supported (high confidence). The statistic, the rank, the comparison and the wording all match Eurostat. A secondary sentence, that high earners were more affected, holds for 2023 but is loosely worded (sub-claim E).

WHAT WOULD MOVE THE VERDICT UP

None: Supported is the top of the scale.

WHAT WOULD MOVE IT DOWN

A revision of Eurostat’s 2023 figures that removed Malta’s lead, or evidence that the Maltese result comes from a question, translation or sampling artefact rather than from what residents report.

IN THIS REPORT

- 1 The claim and what we could verify
- 2 Method
- 3 What the indicator measures
- 4 What the data show

- 5 Where the evidence points different ways
- 6 Testing the claim
- 7 Verdict and requests for evidence
- 8 Limitations

1 The claim and what we could verify

The claim is Amphora Media’s own text, read in full on 5 October 2026 [1]. Amphora is a news outlet; we assess its wording, not any authority’s. The guidebook names no source for the figures and links none. Only the income sentence is attributed, to “the report”, which is not named. We identified the Eurostat data that reproduce the figures [2] and the Eurostat publications that report them in the same terms [5, 6].

What Amphora says	Where	Access
“35% of people in Malta reported exposure to pollution in 2023 — the highest share in the EU.”	Introduction [1]	Read in full; no source given
“In 2023, more than a third of people (35%) in Malta reported exposure to pollution, grime, and other environmental problems. This is the highest share in the EU and nearly three times the EU average of 12%.”	Section “Is Malta becoming cleaner?” [1]	Read in full; no source given
“According to the report, high-earning households were more affected than low-earning ones.”	Same section [1]	Read in full; “the report” not named

Likely source. Eurostat’s *Statistics Explained* article on the natural and living environment (last edited 14 August 2025) says Malta recorded “by far the highest share” (34.7%) of people reporting exposure to pollution, grime or other environmental problems, and names Malta among nine Member States where people at risk of poverty reported less (5.5 points lower) [5]. Eurostat’s news release of 1 September 2025 is headed “12% of EU population reported pollution in their area” [6]. Together they carry all three of Amphora’s statements. We cannot confirm that Amphora used them.

SCOPE NOTE

This check tests the figures and the wording “reported exposure to pollution”. It does not assess Malta’s actual air or environmental quality, which is covered by other checks. Amphora’s guidebook contains other statements that we did not test here.

2 Method

Question. Are the 35%, the “highest in the EU” ranking and the comparison with a 12% EU average accurate, does “reported exposure to pollution” describe what was measured, and is the income statement right?

Evidence. This claim is statistical. We downloaded Eurostat’s *ilc_mddw02* (updated 13 August 2026) and the at-risk-of-poverty rate *ilc_li02* through the dissemination API on 5 October 2026 [2, 11], kept all Member States, years and Eurostat’s flags, and recomputed rank, ratios, trend and the income split with *tools/cc-037-report/calc.py* from *data/cc-037/*. We read Eurostat’s methodology note for the indicator [7], its 2025 article and news release [5, 6], and the EU legal acts that set how often the question is asked [8–10], all on 5 October 2026. Peer-reviewed literature was searched (Crossref, OpenAlex) for work comparing self-reported pollution with measurements.

Grades. Official statistics are grade C under our scale. **Verdicts** follow the five-point scale in Appendix A.

3 What the indicator measures

The indicator comes from the EU Statistics on Income and Living Conditions (EU-SILC), a household survey run by national statistics offices. One respondent answers for the household: does it have a problem with “pollution, grime or other environmental problems” in the local area, such as smoke, dust, unpleasant smells or polluted water? Eurostat then counts every person living in a household where the answer was yes, weighted to the population of private households; the indicator is that share [7]. It records whether the respondent considers this a problem for the household, and Eurostat sets no common standard for what counts as one [7].

Eurostat’s own publications describe the result as people “reporting exposure to pollution, grime or other environmental problems” [5] and speak of “self-reported exposure” [5]. Amphora’s wording follows that usage.

Self-reports and measurement overlap but do not coincide. In one Spanish cohort of 504 pregnant women, self-reported air-pollution annoyance was associated with modelled NO₂ and VOC levels, but category-by-category agreement was low to moderate (11–72%) [3]. That is a conference abstract from another country and is context only.

Why there are no figures for 2021 and 2022

Until 2020 the question was asked, and the indicator published, every year. Since 2021 EU-SILC has run under Regulation (EU) 2019/1700, which collects some items every year and others every three or six years [8]. The pollution question (variable HS180) is now part of the three-yearly module “Labour market and housing” [9], which the Commission’s rolling plan schedules for 2023 and 2026 [10]. Eurostat’s release says the same: the data come from a module “collected every 3 years” [6]. So 2023 is the first year of the new cycle, and the next figures will be for 2026.

4 What the data show

Figure 1. Population reporting pollution, grime or other environmental problems, Malta and EU-27. Malta's series peaked at 41.4% in 2011, fell to 26.5% in 2017 and has risen since; 2023 is the highest since 2014 (37.4%). The question was not asked in 2021–22. EU-27 values for 2010–2020 are Eurostat estimates (flag e, hollow markers); Malta's values carry no flags.

Figure 2. The same indicator for all 27 Member States, 2023. Malta ranks first. Germany's value (16.8%) is flagged by Eurostat as of low reliability.

Indicator	Malta	EU / comparison	Source	Grade
Reporting pollution, grime or other problems, 2023	34.7%	12.2% (EU-27)	Eurostat [2]	C
Ratio to EU-27 average, 2023	2.84×	2.92× on the rounded 35% and 12%	calculated	C
Rank among 27 Member States, 2023	1st	Greece 20.5%, Germany 16.8% (low reliability), France 16.0%	calculated	C
Years ranked first, 2005–2023	17 of 17	25–27 Member States with data each year	calculated	C
Change since the 2017 low	+8.2 points	26.5% → 34.7%; highest since 2014 (37.4%)	calculated	C
Above / below 60% of median income, 2023	35.6% / 30.1%	11.8% / 14.0% (EU-27)	Eurostat [2]	C
People above 60% of median income, 2023	83.4%	at-risk-of-poverty rate 16.6% (EU-27 16.2%)	Eurostat [11]	C

All values in data/cc-037/checks.csv. Member States with data: 25 in 2005–06 (none for Croatia and Romania), 26 in 2007–09 (none for Croatia) and in 2020 (none for Poland), 27 in the other years. No data for 2021 and 2022 (section 3).

5

Where the evidence points different ways

Q1 Is “reported exposure to pollution” an accurate description?		ACCURATE; EUROSTAT’S WORDING
EVIDENCE FOR THE CLAIM’S IMPRESSION Eurostat itself describes the indicator as people “reporting exposure to pollution, grime or other environmental problems” [5]. Amphora’s body text uses the full wording, and “reported” makes clear that this is what people said.	EVIDENCE AGAINST Read alone, “exposure to pollution” could be taken as measured exposure, which the survey does not provide, and “grime” covers dirt that is not pollution in the regulatory sense.	
WHY THEY DIFFER, AND WHAT IT MEANS HERE For this claim: Amphora shortened Eurostat’s wording; it did not change its meaning. Holding a news outlet to stricter wording than the statistics office uses would not be an even standard, so we give this as context for readers, not as a flaw in the claim.		

Q2 Does the ranking reflect real conditions or a survey effect?		UNCERTAIN; RANKING IS ROBUST
EVIDENCE FOR THE CLAIM’S IMPRESSION Malta has led the EU in all 17 survey years with data, and in 2023 by 14.2 points, so a single year’s sampling noise does not explain it.	EVIDENCE AGAINST Perception varies with expectations, and Eurostat sets no common standard for what counts as a problem [7]. We found no study that separates these effects for Malta.	
WHY THEY DIFFER, AND WHAT IT MEANS HERE For this claim: the rank is accurate as a statement about reports. Causes are outside this check.		

6

Testing the claim

Sub-claim	What the evidence shows	Rating
A. 35% of people in Malta reported pollution in 2023	Eurostat: 34.7% [2].	ACCURATE
B. The highest share in the EU	First of 27; Greece second at 20.5%; first in all 17 years with data [2].	ACCURATE
C. Nearly three times the EU average of 12%	12.2% EU-27; ratio 2.84 (2.9 on the rounded figures) [2].	ACCURATE
D. “Exposure to pollution” (intro wording)	Eurostat’s own wording, shortened: it describes the indicator as people “reporting exposure to pollution, grime or other environmental problems” [5]. The survey records reported problems, not measured exposure [7].	ACCURATE (OFFICIAL WORDING)
E. High earners more affected than low earners	2023: 35.6% above vs 30.1% below 60% of median income [2]. But the “above” group is 83.4% of people, not high earners [11]; the gap reversed in 6 of 17 years; EU-wide it runs the other way.	LARGELY ACCURATE

The income sentence (E). Eurostat splits the indicator at 60% of median equivalised income, the at-risk-of-poverty line, not by earnings bands [7]. In Malta in 2023, 16.6% of people were below that line [11], so the “above” group is 83.4% of the population; most of it is not “high-earning”. For 2023 the direction Amphora gives is right, and Eurostat notes it: Malta is one of nine Member States where people at risk of poverty reported less (5.5 points lower) [5]. It is not a stable pattern: in 6 of the 17 survey years (2006, 2007, 2009, 2010, 2016 and 2018) people below the line reported more. Across the EU-27 the pattern runs the other way (14.0% below, 11.8% above, 2023) [2]. Eurostat’s article gave 14.1% and 11.9% from an earlier extraction [5].

7 Verdict and requests for evidence

VERDICT

SUPPORTED

The figures, rank, comparison and wording match Eurostat's data and Eurostat's own description of them. Confidence: high.

Why. (1) The 35%, the first place in the EU and the comparison with the EU average all reproduce from Eurostat's own data. (2) The result is stable across 17 survey years. (3) "Reported exposure to pollution" is Eurostat's own description of the indicator, shortened; it is context for readers, not a flaw in the statement. (4) Confidence is high because the data, Eurostat's methodology note and its own publications agree. The verdict applies to the claim under review, the intro line and its restatement in the body. The income sentence is a separate statement, rated on its own (E).

What this verdict does not say. It does not say that Malta's measured pollution is the highest in the EU, that any particular source is to blame, or that any authority has failed. It addresses only whether Amphora's statement is accurate.

Evidence we are asking for

- ☐ The source Amphora refers to as "the report" for the income split, and the source of the 35% (neither is named in the guidebook).
- ☐ Measured exposure data (EEA air quality, noise maps) that could be set beside this perception indicator in a future check.

8 Limitations

- The indicator is self-reported and cannot be read as measured exposure.
- We did not compare it with measured concentrations in Malta; no such comparison was part of the claim.
- The question was not asked in 2021–2022 (three-yearly module since 2021); 2023 is the latest year and the next is 2026.
- Amphora names no source; the match to Eurostat's data and publications is ours, through the figures (35%, 12%, the income split).
- Eurostat flags the EU-27 values for 2010–2020 as estimates and Germany's 2023 value as of low reliability; Malta's values carry no flags.
- The Aguilera abstract [3] is a conference abstract from Spain; it was read as an abstract only and is context.

Appendix A: series standards and verdict scale

Every investigation in this series follows the same rules so that verdicts are comparable and challengeable.

Verdict	Meaning
SUPPORTED	Evidence consistently backs the claim as stated.
LARGELY SUPPORTED	Backed by the evidence, with minor caveats that do not change the substance.
NOT SUBSTANTIATED	Stated more strongly than the evidence offered or available allows. May be true in some conditions but has not been shown.
MISLEADING	Omits material facts so that the overall impression is inaccurate, even if individual statements are defensible.
CONTRADICTED	The available evidence points against the claim.

Confidence

High: multiple independent lines of evidence agree. **Moderate:** evidence is relevant but incomplete or indirect. **Low:** evidence is thin, second-hand or conflicting.

Evidence grades

A experiment · B observational study with a control or gradient · C review, guidance or official statistics · D assertion or anecdote. ♦ marks a source known only second-hand.

Standards

- **Quote the speaker, not the headline**, with outlet and date, and link the original where possible.
- **Separate the claim from the evidence offered for it**, and say who made which statement.
- **Grade the evidence** and show differing views side by side where the evidence is unsettled.
- **State what we could not access or verify**, and what would change the verdict either way.
- **Ask for the missing evidence** in specific, answerable requests.
- **Offer a right of reply** where a check finds a claim Not substantiated, Misleading or Contradicted (or a pledge Not measurable, Off track or Missed), before wider circulation, and append responses.
- **Correct errors openly** with a version number and change log.
- **Whistle-blow only on evidence:** a verdict of *Misleading* or *Contradicted* requires documents or data that can be shown, not inference.
- **Check every side.** Government, opposition, NGOs and developers are held to the same standard.

Appendix B: revision log

Version	Date	Change
1.0	5 Oct 2026	First issue. No right of reply needed for a Supported verdict.
1.1	5 Oct 2026	Corrections: (1) Amphora names no source and links none; the cover, flyer, references and claim record no longer say it cites Eurostat, and section 1 now says that only the income sentence is attributed, to an unnamed “report”. Likely source added: Eurostat’s Statistics Explained article (last edited 14 Aug 2025) and news release (1 Sep 2025) [5, 6]. (2) Sub-claim D re-rated Accurate (official wording): “reporting exposure to pollution” is Eurostat’s own description of the indicator, so the verdict no longer treats it as a caveat. (3) Sub-claim E re-rated Largely accurate: the split is above against below 60% of median income, and the “above” group is 83.4% of people; the direction reversed in 6 of 17 years; EU-wide it runs the other way (14.0% below, 11.8% above). (4) TL;DR point 4 “Not a recent deterioration” replaced: +8.2 points since 2017, the highest since 2014 (37.4%). (5) The 2021–22 gap explained: the question moved to a three-yearly EU-SILC module collected in 2023 and 2026 [8–10]; removed from the requests. (6) “Move the verdict up” box: none (top of the scale); a Eurostat revision or a survey artefact moved to “down”. (7) Unsourced sentence on density and traffic removed; the indicator is now defined precisely (people living in households where the respondent reports the problem) [7]. (8) Eurostat flags kept (EU-27 2010–2020 estimated; Germany 2023 low reliability); Figure 1 no longer bridges 2021–22; Figure 2 labels to one decimal; table note kept with its table; cover status “draft · no right of reply needed”. Verdict and confidence unchanged.
