

Renewables by 2030: solar PV and offshore wind?

Malta's national energy plan, tested against its own sums and Eurostat data

THE CLAIM

“Increase the Renewable Energy contribution from 11.5% to 25% through multiple initiatives ...”

Government of Malta, final updated National Energy and Climate Plan, December 2024

Our record summarises it as reaching the 2030 share through solar PV and offshore wind.

The plan's own projection (24.5%) counts no offshore wind: it is not expected to be commissioned by 2030.

VERDICT

MAIN RESULTS

24.5%

The 2030 figure

The plan projects 24.5% (summary: 25%). The 11.5% in some summaries is the earlier contribution.

0 MW

Offshore wind counted

“Offshore wind does not contribute” to 2030, the plan says; its 350 MW is dated 2030 in one place, 2050 in another.

17.2%

Share in 2024 (Eurostat)

Ahead of the plan's 15.5% path. The rise is in heating and cooling; the electricity share moved from 9.5% to 10.7%.

16 vs 11.5

MWp of solar PV a year

Needed to reach 350 MWp by 2030, against the net addition in 2024. The plan gives no sum in points of share.

28%

The Commission's formula

It finds 24.5% below the 28% its formula gives, and the 2025 and 2027 points below its reference points.

FAIR TO SAY

On the plan's own path Malta is ahead (pledge label: on track). The plan itself discloses that offshore wind is left out of the 2030 sum. Cyprus, another island, reached 20.8% in 2024.

WHAT WOULD SETTLE IT

- ☐ A breakdown of the 24.5% by technology and sector.
- ☐ When offshore wind is expected to be commissioned.
- ☐ The planned pace of solar PV additions to 2030.
- ☐ The 2019 plan's wording on the 11.5% figure.
