

37.7% of new cars zero-emission?

The European Commission's 2026 Country Report, tested against Eurostat

THE CLAIM

“...7 700 new passenger car registrations, of which 37.7% were ZEVs ... well above the EU average of 13.6%.”

European Commission, 2026 Country Report – Malta, 3 June 2026

Annex 8; up 17.4 points from 20.3% in 2023.

ZEV: battery electric or hydrogen. Plug-in hybrids do not count.

VERDICT

SUPPORTED

*The figures reproduce;
Malta is second in the EU.*

MAIN RESULTS

37.7%

New cars, 2024

Eurostat: 2,893 of 7,683 new cars were battery electric. In 2023 the share was 20.3%.

2nd

Rank in the EU

Only Denmark (51.3%) was higher. Sweden and the Netherlands follow at about 35%.

13.5%

EU-27 average

Eurostat's figure; the report says 13.6%. The tenth of a point changes nothing.

2.2%

Share of the whole fleet

Zero-emission cars were 2.2% of 330,484 cars at the end of 2024, the EU average.

+18/day

Fleet growth, 2024

The car stock grew by 6,632. The report says charging points lag behind.

FAIR TO SAY

The passage is accurate. A fast-changing new-car market is not yet a cleaner fleet; transport emissions are checked in CC-109.

WHAT WOULD SETTLE IT

☐ Commission: the source of the 13.6% EU average.

☐ Transport Malta: charging points against plan.

☐ Annual fleet emissions from road transport.

☐ Readers: new cars are not the fleet.
