Council on Malta's renewables: the numbers

The Council's draft Recommendation, tested against Eurostat data

THE CLAIM

"Malta's share of renewables … (17.2% in 2024) and in the electricity mix (16.7% in 2025) remains very low …"

Council of the European Union, draft Recommendation on Malta, 3 July 2026

Almost exclusively solar, "with no wind or hydropower generation recorded".

Every figure reproduces from Eurostat; the 16.7% is the share of domestic net generation, which the text does not say.

VERDICT

LARGELY SUPPORTED

Figures reproduce; one measure unnamed.

SUPPORTED | **LARGELY SUPPORTED** | NOT SUBSTANTIATED | MISLEADING | CONTRADICTED

MAIN RESULTS

17.2%

Renewables in 2024

Exact (Eurostat). EU-27: 25.2%. Only Belgium, Luxembourg and Ireland are lower.

16.7%

Renewables in 2025 electricity

Matches Malta's domestic net generation (363 of 2,176 GWh). Eurostat's consumption-based indicator gives 11.2% (provisional).

47%

EU-27 renewables in generation

The EU-27's share of net generation in 2025 (47.3%); Malta is second lowest of 27.

97%

Solar share of renewables

PV is 326.7 of 336.0 GWh in 2024; the rest is biogas. No hydro in any year.

0.03 GWh

Wind generated in 2024

A trace in Eurostat's annual table (0.01% of renewable output): "none recorded" holds to rounding.

FAIR TO SAY

The text does not say which electricity measure 16.7% is. It is the more favourable of three readings, and every one is far below the EU's. This is a draft text of 3 July 2026; the adopted version was not checked.

WHAT WOULD SETTLE IT

- ☐ The source and measure behind "16.7% in 2025".
- ☐ Whether the adopted text keeps paragraph (25) unchanged.
