

Renewables by 2030: onshore and offshore?

Malta's national energy plan, tested against its own sums and Eurostat data

THE CLAIM

“Increase the Renewable Energy contribution from 11.5% to 25% through multiple initiatives ...”

Government of Malta, final updated National Energy and Climate Plan, December 2024

The plan lists offshore technologies as a means; its 2030 projection counts none.

The plan's own projection (24.5%) counts no offshore wind: it is not expected to be commissioned by 2030.

VERDICT

NOT SUBSTANTIATED

*On the plan's own path;
offshore means not counted.*

MISLEADING

CONTRADICTED

MAIN RESULTS

24.5%

The 2030 figure

The plan projects 24.5% (summary: 25%). 11.5% is the earlier contribution the plan raises.

0 MW

Offshore wind counted

“Offshore wind does not contribute” to 2030, the plan says; its 350 MW is dated 2030 in one place, 2050 in another.

17.2%

Share in 2024 (Eurostat)

Ahead of the plan's own 15.5% path (the Commission's reference points are higher). The rise is in heating and cooling; the electricity share moved from 9.5% to 10.7%.

350 MWp

Solar PV expected by 2030

From 241 MWp at end-2023, the plan's own figures (pp. 74, 84). It gives no sum in points of share.

28%

The Commission's formula

It finds 24.5% below the 28% its formula gives, and the 2025 and 2027 points below its reference points.

FAIR TO SAY

Malta is ahead of the plan's own path (pledge label: on track, on that path only). The plan itself discloses that offshore wind is left out of the 2030 sum. Cyprus, another island, reached 20.8% in 2024.

WHAT WOULD SETTLE IT

☐ A breakdown of the 24.5% by technology and sector.

☐ When offshore wind is expected to be commissioned.

☐ The planned pace of solar PV additions to 2030.

☐ The 2019 plan's wording on the 11.5% figure.
