

Is transport 48% of Malta's effort-sharing emissions?

A European Commission statement, tested against EEA and Eurostat data

THE CLAIM

“It has generated 48% of these emissions in 2024, up by 45% since 2005.”

European Commission, 2026 Country Report – Malta, SWD(2026) 218 final, 3 June 2026, p. 66

The passage begins: “Transport is the dominant source of Malta's effort sharing emissions.” Also pp. 6, 14.

Effort sharing: emissions outside the EU emissions trading system, under Malta's national target. 2024 data approximated.

VERDICT

LARGELY SUPPORTED

Transport dominates and is up 45%; its share is 53%.

MAIN RESULTS

53%

Share on the report's definition

Transport excluding aviation CO₂, 2024: the report's own Graph 3.1 shows 53.3%. Its text says 48%.

+45%

The rise since 2005 holds

0.53 to 0.76 Mt on the approximated 2024 data the report uses. Malta's final 2026 inventory: +48%.

20 of 20

Largest sector every year

Transport has been Malta's biggest effort-sharing source in every year since 2005. Next: small industry, 19–20%.

48.0%

One route to 48%

Road transport alone divided by the effort-sharing total. Our identification: the report does not say how it got 48%.

12%

Not only road

Domestic shipping is 11.9% of effort-sharing transport (2024), up 184% since 2005. The report labels the series “road transport”.

FAIR TO SAY

The Commission's message holds, and more strongly than its 48% suggests: transport dominates Malta's effort-sharing emissions and keeps rising, while across the EU-27 the same sector fell 5% (2005–2024).

WHAT WOULD SETTLE IT

☐ The calculation behind the 48% (Commission).

☐ Whether its “road transport” series includes shipping.

☐ Final 2024 figures after the 2027 review.

☐ The EEA's 2024 sector split, as a table.
