

20 km of tunnels: do they manage flooding?

A public claim, tested against official sources and rainfall data

THE CLAIM

“...they avoid flooding and damage caused by waters every time it rains.”

Attributed by TVM News to Mario Ellul, Public Works Department, 4 July 2025

Said as the department works to extend the network from 16 km to a 20 km total.

The department puts 16 km in use and 20 km as the planned total.

VERDICT

NOT SUBSTANTIATED

*Plausible by design,
but not shown.*

MAIN RESULTS

16 km

In use now

Public Works Department, 4 July 2025. A further 4 km is planned.

20 km

The planned total

The department's own figure for the network once a further 4 km is built.

5-year

Design storm

The European Commission says the system is built for a 5-year storm over 65 km².

2020

Flooding continued

Roads flooded in project localities in September 2020; two more tunnels were planned in 2022.

0

Before-and-after counts

No published flood-incident series found in the sources we searched, so the effect cannot be measured.

FAIR TO SAY

The tunnels are real and were built to reduce flooding, and the department maintains them every year. This check is about the effect and the words “every time it rains”.

WHAT WOULD SETTLE IT

☐ Flood incidents by locality, 2005 to date.

☐ Design storm for each catchment.

☐ Operating length of each tunnel.

☐ The Agency's before-and-after comparison.
